Introduction

The card game industry has become a source of entertainment,
offering players both fun and challenges.
With the evolution of technology, many traditional card games have
transformed into digital formats.

Objectives of the game

This project develops a Python multiplayer card game using client-server architecture. It features a unique scoring system, a Tkinter GUI, and real-time gameplay via sockets. A MySQL database stores player info and game results. The system is scalable for future updates.

Functionalities

➤ **Game Logic**

The game should handle edge cases like ties and identical cards/suits according to the defined rules.

➤ **Multiplayer Support**

The system must allow multiple clients to connect and play against each other via a central server.

➤ **Database Management**

Player data, including login credentials, game results, and session history, should be stored in the MySQL database.

➤ **Real-Time Communication**

The server should handle incoming client requests, manage game states, and broadcast updates to all connected clients.

02

Applied Technologies

Technologies

- **User Interface**

 - Tkinter Library

- **Data Storage**

 - MySQL database

- **Network Communication**

 - Socket Programming

TKINTER

Python Tkinter is a standard GUI (Graphical User Interface) library used to create desktop applications. It provides an easy way to build interactive interfaces with elements like buttons, labels, text fields, and menus. Tkinter is simple to use and comes bundled with Python, making it accessible for developing basic to moderately complex applications quickly.

Why Tkinter?

Easy to use: Simple and intuitive syntax for beginners.

Built-in Python library: No need for additional installation, as it comes pre-installed with Python.

Cross-platform: Works on Windows, macOS, and Linux.

Lightweight: Suitable for small to medium-sized GUI applications.

Customizable: Allows customization of widgets, layouts, and designs.

Active community support: Plenty of tutorials and resources available.

Integration-friendly: Can be easily integrated with other Python libraries like Pillow for image handling.

MySQL Database

- ❖ MySQL is an open-source relational database management system that uses SQL to manage data.
- ❖ It is known for its reliability, scalability, and ease of use, making it popular for web applications, data storage, and handling large datasets.
- ❖ MySQL supports features like data security, transactions, and multi-user access.

Why MySQL?

Open-source: Free to use and modify with a large community of contributors.

Reliable: Proven track record of stability and performance.

Scalable: Handles large volumes of data and high traffic efficiently.

Ease of use: Simple to set up and manage, with extensive documentation and support.

SQL support: Uses Structured Query Language for powerful data manipulation and queries.

Cross-platform: Works on various operating systems including Windows, macOS, and Linux.

Security features: Provides robust security options and user management.

SOCKET PROGRAMMING

Socket programming is a way of connecting two nodes on a network to communicate with each other. One socket(node) listens on a particular port at an IP, while the other socket reaches out to the other to form a connection. The server forms the listener socket while the client reaches out to the server.

Game Rules

SHAN KOE MEE

CARDS

Rule No.1

Every player gets 2 cards and has the right to draw one extra card.

Rule No. 2

The value depends on the combination of the cards together. If the score is higher than 10, you must ignore the 2nd digital

For example, 15=5, 10=0, 33=3

Rule No. 3

To win the game, you must get the higher score.

In case the score is equal in value, then the hand who gets less cards is the winner.

Rule No. 4

- ❖ If the score and number of cards are equal, the value of the card decides the winner.
- ❖ The orders are A,K,Q,J,10,....,2.

VS

Rule No. 4

- ❖ If the value is the same, look at the suits of the highest value of the card.
- ❖ The order is Spade, Heart, Diamond and Club.

VS

EXAMPLES

- DECK (5,5,7) Vs DECK (3,4) => DECK (3,4) is the winner.
- DECK (Q,6) Vs DECK (2,4) => DECK (Q,6) is the winner.
- DECK (Heart of 7, Club of 2) Vs DECK (Diamond of 7, Spade of 2)
the first deck is the winner.

THANKS!

"Know your risk and Bet the slip"
